

# Sell anywhere. Comply everywhere.

One product can carry more than a hundred rules across the markets it sells in. Cleo reads the official texts, ties every rule to your own references, and tells you what changes before the deadline reaches you.

**106**

countries covered

**25,000**

regulations indexed

**19,000**

regulatory authorities followed

Coverage figures published by Cleo Labs.

**Authorities publish continuously. A handful of it lands on your catalogue.**

Cleo names the one that applies, quotes its article, and dates it.

**Regulation (EU) 2023/988, Article 19(d)**

General Product Safety Regulation • what a distance offer must show, in the language the Member State sets

**13 Dec 2024**

applies since

## MISSION

**Turn the rule into something a machine can act on.**

Every other function of the company runs on structured data. Product compliance still runs on documents read by hand. We encode the obligation itself and keep the wording of the official source with it, so a team checks a product instead of rereading a text.

## VISION

**Compliance as an infrastructure layer.**

Current, sourced, and callable from the systems you already run: the PLM, the product record, the supplier questionnaire. You open a market because the answer is there, not because someone found the time to look for it.

## Four products on the same rule base. You start with the one you need first.

### Regulatory Change

01

**You hear about a deadline once it has passed.**

- Official journals, market authorities and notified bodies, read every day
- Each publication tied to the product range it touches
- The application date, apart from the publication date, and the days you have left

### Research

02

**The answer sits in an annex nobody has time to open.**

- One product, one market, one question, asked in plain language
- The answer quotes the article it comes from, annexes included
- Every source opens on the official text, at the right paragraph

### Compliance Data

03

**Your PLM cannot read a regulation.**

- The obligation encoded as a testable rule, with the source wording kept beside it
- One verdict per reference, called from the systems you already run
- The inputs a rule needs are named, so a supplier can answer them

### Compliance as a Service

04

**Some answers need a name under them.**

- Our experts write, review and sign the analysis
- They encode the rules your catalogue needs first
- They stay on the file as the text is amended

#### 01 • Catalogue

##### Your references

Product records, materials and markets, as you already keep them.

#### 02 • Mapping

##### Rules that apply

Agents tie each reference to the texts in force for its markets.

#### 03 • Verdict

##### Reference by reference

Each encoded rule answers on the product, with the wording it used.

#### 04 • Watch

##### What changes next

An amendment to the text reopens the products it touches.

#### WHERE THE MACHINE STOPS

**We publish how a rule is checked, not only what it answers.**

##### Missing data

When a rule needs an input the file does not carry, the answer says which input is missing, field by field. The system states what it does not know instead of filling the gap, and a human signature is recorded wherever one has been given.

#### FROM A CUSTOMER

"At Decathlon, our challenge is capturing very precise information out of a massive volume of international product regulations, with both a legal and a technical stake: steering our global compliance while supporting our engineers in product development. That's the bridge we're building with the PoC we ran with Cleo: their AI engine acts as an intelligent translator that filters noise to extract structured data, directly actionable by our teams and essential to guide design inside our PLM."
